

To change line spacing in the whole document use the command `\linespread` covered in Text Formatting.

To change line spacing in specific environments do the following:

1. Add `\usepackage{setspace}` to the document preamble.
2. This then provides the following environments to use within your document:
 - `doublespacing` - all lines are double spaced.
 - `onehalfspacing` - line spacing set to one-and-half spacing.
 - `singlespacing` - normal line spacing.
3. To change line spacing to custom values, use the command `\setstretch{baselinestretch}` in the preamble to change line spacing for the whole document or use the environment `\begin{spacing}{2.5} ... \end{spacing}` to change the line spacing to whatever is greater, the document-wide or environment-wide one.
